

Mission Scientist Report for Monday, 3 June 2013

Submitted by tjang on Mon, 06/03/2013 - 12:16

Date:

Monday, June 3, 2013 - 12:00

Discussion:

XPOLs are green. Surface instrumentation is green. D3R is green. NPOL was staffed through 12 UTC on 2 June 2013, and then re-staffed starting 16UTC on 3 June. During the interim period, NPOL was kept in 10-min rain maps and minimal to no precipitation observed. Around the UTC date change on 1-2 June, a couple lines of shallow convection rolled over NPOL and were scanned by NPOL/D3R using RHI sectors and rain maps while they affected the disdrometerradial. Earlier on 1 June several tests and calibrations were performed during a quiet weather period, and NPOL checked out normal with no significant changes from previous calibrations.
